Prior to the detailed evaluation, the Employer will determine whether the bid is of acceptable quality, is generally complete and is substantially responsive to the bidding document. For purpose of this determination, a substantially responsive bid is one that conforms to all the terms, condition and specifications of the bidding documents without material deviations, objections, conditionality or reservations.

If a bid is not substantially responsive, it will be rejected by EMPLOYER, and may not subsequently be made responsive by the Bidder by correction of the nonconformity.

It will be based upon an examination of documentary evidence of bidder's qualification submitted by the bidder in Techno-Commercial Bid as well as such other information as EMPLOYER deems necessary and appropriate. Notwithstanding anything stated anywhere else in the bidding documents, EMPLOYER reserves the right to seek in writing information relating to qualifying requirements in addition to details contained in the bid. RGPPPL reserves the right to verify any claims made by vendors and to carry out a capability assessment. The decision of RGPPPL shall be final in this regard. Notwithstanding any stated above, RGPPPL reserves the right to undertake a physical assessment of the capacity and capabilities including financial capacity and capability of the Bidder to perform the Contract, should the circumstances warrant such as assessment in the overall interest of RGPPPL. Bids not meeting the requirements as stated in the Bidding Documents/NIT shall be rejected.

An affirmative determination of meeting the qualifying requirements will be a prerequisite for further evaluation of Techno-Commercial bid. A negative determination will result in rejection of the Bidder's Techno-Commercial Bid in which event EMPLOYER will not open the Price Bid of the concerned bidder and his Earnest Money Deposit shall be returned. **NIT No.: RGPPL/C&M/CS-2802/OT-109****Sub: Biennial Contract for Cooling Water Treatment at RGPPL Power Block.****(Section- C)****Scope of Work and Special Terms & Conditions of Contract****1. Introduction & Scope of Work:**

1.1 RGPPL is producing electricity to the tune of 500 MW with one block operation or in split two block operation. Accordingly, this cooling water treatment proposal at Ratnagiri Gas and Power Pvt. Ltd. is intended to treat the CW and OCW systems of Phase-2 combined cycle gas power plants. Each block consists of two gas turbines (GT) associated HRSG and one Steam Turbine (ST) with design capacity of 663.54 MW. Steam turbine capacity for each block is nearly 230 MW at full load. Cooling water system includes:

1.1.1 Condenser cooling water system (CW) for ST using sea water as per details at para 8.1

1.1.2 Open Cooling Water System (OCW) for Auxiliaries using filtered water as per details at para 8.2

1.2 The scope of work involves study, recommendation and successful implementation of suitable chemicals/ chemical formulations for the cooling water systems 1.1.1 and 1.1.2, as above, of ONE BLOCK or SPLIT BLOCK (two blocks) as per operational requirements against possible corrosion/scale and deposits/fouling. It shall include monthly demonstration of the performance guarantees of the chemicals/formulation as given in Para 3 below.

1.3 The Bid shall include the study report, basis for selection of chemicals and their formulations, chemical dosages and recommendations, complete literatures of the chemicals and their formulations including MSDS, quality control checks, operational parameters to be monitored, methodology of monitoring, recent trends in cooling water treatment especially in the sea water environment etc.

2. Recommended Chemicals and Their Quantity Requirement:

2.1 Being a combined cycle gas power plant with combination of two gas turbines/ HRSG and a single steam turbine, manual cleaning is not possible for many of the system. Hence the chemicals in use should be in a position to effectively control corrosion, scale and biological growth in the system throughout the treatment period.

2.2 Bidders shall provide details of the treatment chemicals, their mechanism of working, active ingredient and its content, literatures in favour of the recommendations, limitations of the programs, if any, and other details as necessary considering the system and operational details provided in this document and collected from site.

2.3 Condenser Cooling Water System (CW System – Sea Water cooling): Depending on the operational conditions the COC in the system will vary from 1.4 – 2.0. Yearly average COC is expected to be 1.6 and bidder has to quote for 1.6 COC. **RGPPPL reserves the right to suspend the treatment if the COC is <1.5 and also to change the treatment from one block to the other or to keep treatment in both blocks as required.** As there is no pretreatment for the sea water, the turbidity and biological contents may vary from season to season. The effluent is discharged to sea and so should meet the effluent regulations stipulated by MPCB/CPCB. Chlorination will be done by RGPPL to maintain free residual chlorine (FRC) between 0.2-0.6 ppm in the CW system and acid dosing to control the alkalinity in the range of 160-170 at a pH range of 8.2-8.4. The chemicals in use should be effective in control of biological fouling

and deposits in the system, particularly, algae growth in CT fills, deposits in plate heat exchangers used in CCW system and Steam turbine condenser. Carbamate based biocide is found to be more effective than quaternary ammonium salts based biocide. Effective biocide like chlorine dioxide may be used to control the variations in the biological growth and latest anti dispersants for the control of slime, loose and hard scales. Bidder is requested to quote for alternate chemicals for chlorine, which will be used if chlorination fails for more than 4 days.

2.4 Auxiliary Cooling Water System (OCW System: Filtered Water Cooling): Make up water is filtered water with almost nil residual chlorine. The system is expected to work around 6 COC. There shall be no acid dosing into the system for pH control or any additional chlorine dose. Biological control is to be highly effective so also the corrosion and deposit controls. Corrosion inhibitors may include Zinc, polyphosphate & molybdate. Scale inhibitors may include organophosphonates including PBTC, and low molecular weight polyacrylate, polymethacrylate, polymaleate etc. Biocide used should be non-foaming. Quaternary ammonium based biocide alone is found ineffective but combination of oxidizing and non-oxidising biocides like chlorine/bromine and isothiazoline or carbamate based compounds is found effective and is preferred in the proposed treatment programme.

2.5 Operational parameters, including the water quality limits, for the systems to maintain the required performance shall be provided by the Bidder. RGPPL intends to optimize the cost of treatment. The dosage of chemicals (for sea water treatment) at COC other than 1.6 will be calculated pro-rata to the chemical quantity quoted for 1.6 COC. Dosages (ppm) calculation at COC other than 1.6 shall be based on the blowdown water quantity. i.e the quantity to be dosed will be the same for all COCs and the only variable will be dosage (ppm). This condition should be acceptable to the Bidder.

2.6 Wherever water meters are not working or the readings are not reliable, the make up water quantity and thus the requirement of treatment chemicals shall be computed as per the calculations (given under the heading Important Notes) provided based on evaporation calculations and COC or as per the residual level of chemicals maintained.

3. Performance Guarantee Requirements:

3.1 CW System:

3.1.1 At given load conditions (condenser inlet and outlet temperatures, circulation rate of cooling water and steam turbine load) deterioration in heat transfer coefficient (U-value) across condenser and major heat exchangers (PHE etc) should not be more than 5% of the original value just before commencement of the proposed treatment. Successful bidder shall install test heat exchanger to simulate and demonstrate the above and the device provided shall be in accordance with NACE RP0189-2002 standard or any relevant National or International standard. Details of standard being followed, along with necessary calculations shall be provided by the party before the start of the treatment.

3.1.2 Successful bidder shall install & maintain biofouling monitor in CW system. Differential pressure across bio-fouling monitor should not exceed more than 20% of the initial value continuously throughout the treatment period. In case limit exceeds beyond the value for 7 days continuously it will be considered to be non-performance.

3.1.3 Successful bidder shall start operation of online monitoring equipments (test heat exchangers, biofouling monitors etc) & demonstrate the required parameters together with start up of their CW treatment programme. Advance preparations, if any, may be made by the successful bidder.

* It may be noted that a secondary cooling of sea water system occurs at the inlet of cooling towers (return header of cooling towers) by chiller water system. According to operational philosophy of chiller water system, cooling water temperature at cooling tower inlet will vary. Hence, it is necessary to maintain the temperature of test heat exchanger in accordance with the water temperature at condenser outlet.

8.2 OCW System (Auxiliary cooling system): For condenser vacuum pump seal water cooler and steam turbine generator hydrogen coolers, open cooling water (OCW) system is employed. System losses as blow down will be around 42 m³/day and the hold up volume will be 76 m³. The system has a provision to change over to plate heat exchangers which use sea water for cooling (closed cooling). In such case, there will be no evaporation loss.

Typical input filtered water (for OCW system) quality is as below:

Parameter	Value
pH	7.0 – 7.5
Total Hardness (mg/l as CaCO ₃)	20 – 32
Calcium Hardness (mg/l as CaCO ₃)	12-25
